   \[4\frac{2}{5} = \frac{5}{5} + \frac{5}{5} + \frac{5}{5} + \frac{5}{5} + \frac{2}{5} = \frac{22}{5}\]. Does his strategy work? Explain.
   Yes; The mixed number \(4\frac{2}{5}\) is made up of a whole number part and a fraction part. Harrison changed the whole number to a sum of fractions with the same denominator as the fraction part of the mixed number. Since 1 whole = \(\frac{5}{5}\), 4 wholes equal \(\frac{5}{5} + \frac{5}{5} + \frac{5}{5} + \frac{5}{5}\), which is \(\frac{20}{5}\). When this is added to the fraction \(\frac{2}{5}\), the total is \(\frac{22}{5}\).
